1 / 1 point

You are using reinforcement learning to control a four legged robot. The position of the robot would be its \_\_\_\_\_.

- ☐ action
- ☐ reward
- ☒ state
- ☐ return

✓ Correct  
Great!

2.

1 / 1 point

You are controlling a Mars rover. You will be very very happy if it gets to state 1 (significant scientific discovery), slightly happy if it gets to state 2 (small scientific discovery), and unhappy if it gets to state 3 (rover is permanently damaged). To reflect this, choose a reward function so that:

- ☒  $R(1) > R(2) > R(3)$ , where  $R(1)$  and  $R(2)$  are positive and  $R(3)$  is negative.
- ☐  $R(1) > R(2) > R(3)$ , where  $R(1)$ ,  $R(2)$  and  $R(3)$  are positive.
- ☐  $R(1) > R(2) > R(3)$ , where  $R(1)$ ,  $R(2)$  and  $R(3)$  are negative.
- ☐  $R(1) < R(2) < R(3)$ , where  $R(1)$  and  $R(2)$  are negative and  $R(3)$  is positive.

✓ Correct  
Good job!

3.

You are using reinforcement learning to fly a helicopter. Using a discount factor of 0.75, your helicopter starts in some state and receives rewards -100 on the first step, -100 on the second step, and 1000 on the third and final step (where it has reached a terminal state). What is the return?

- ☐  $-0.25 \cdot 100 - 0.25^2 \cdot 100 + 0.25^3 \cdot 1000$
- ☐  $-100 - 0.25 \cdot 100 + 0.25^2 \cdot 1000$
- ☒  $-100 - 0.75 \cdot 100 + 0.75^2 \cdot 1000$
- ☐  $-0.75 \cdot 100 - 0.75^2 \cdot 100 + 0.75^3 \cdot 1000$

✓ Correct  
Awesome!

4.

1 / 1 point

Given the rewards and actions below, compute the return from state 3 with a discount factor of  $\gamma = 0.25$ .

- ☐ 25
- ☐ 0.39
- ☒ 6.25
- ☐ 0

✔ Correct

If starting from state 3, the rewards are in states 3, 2, and 1. The return is  $0 + (0.25) \times 0 + (0.25)^2 \times 100 = 6.25$ .
